Create a full-stack web application for downloading publicly hosted direct media files:

1. Frontend (HTML, Tailwind CSS, JavaScript):
   - A clean, modern UI with an input bar for pasting a direct video URL.
   - A button to submit the URL.
   - Loading/spinner animation while fetching data.
   - Display video metadata (title, preview thumbnail).
   - A 'Download' button that initiates the file download.

2. Backend (Node.js/Express or Python/Flask):
   - A POST endpoint `/process-url` that validates the provided URL against allowed domains.
   - Handles stream piping so the file is served with appropriate HTTP headers (Content-Type, Content-Disposition: attachment; filename="...").
   - Includes error handling for invalid links, network timeouts, and file-size limits.
